PS 2.1 Changing people

Human faces, forest places: An examination of urban green equity in multicultural cities

Lorien Nesbitt, PhD
University of British Columbia

The background of the slide is a faded, grayscale aerial photograph of a city. In the foreground, there are residential houses with gabled roofs. In the middle ground, there's a dense urban area with many high-rise buildings. In the background, there are mountains under a clear sky.

Urban Green Equity:

Fair access to, and governance of, urban forests regardless of differentiating factors, such as socioeconomic status, racialization, cultural background, or age

Why does green equity matter?

3.7 billion people

CO₂ sequestration

↑
increased property values and community investment

climate change adaptation

reduced air pollution

shade

emotional health

lower stress
improved attention

reduced flooding

recreation

physical health

increased biodiversity

Practitioner
conceptions
of equity

Spatial
analysis of
distributional
equity

Practitioner conceptions of urban green equity

*How is urban green equity
understood?*

How is it operationalized?

New York

Phoenix

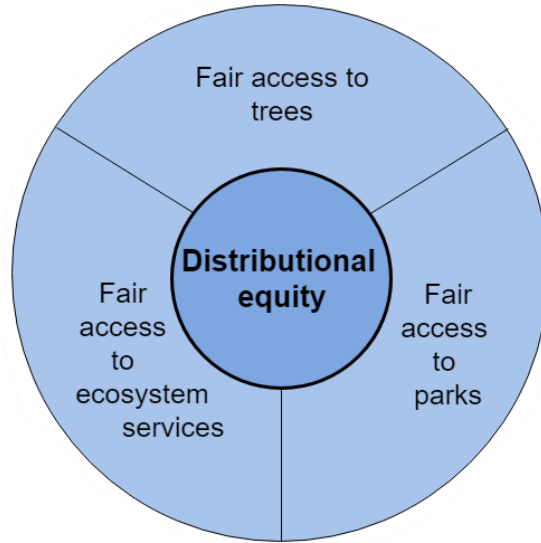

Portland

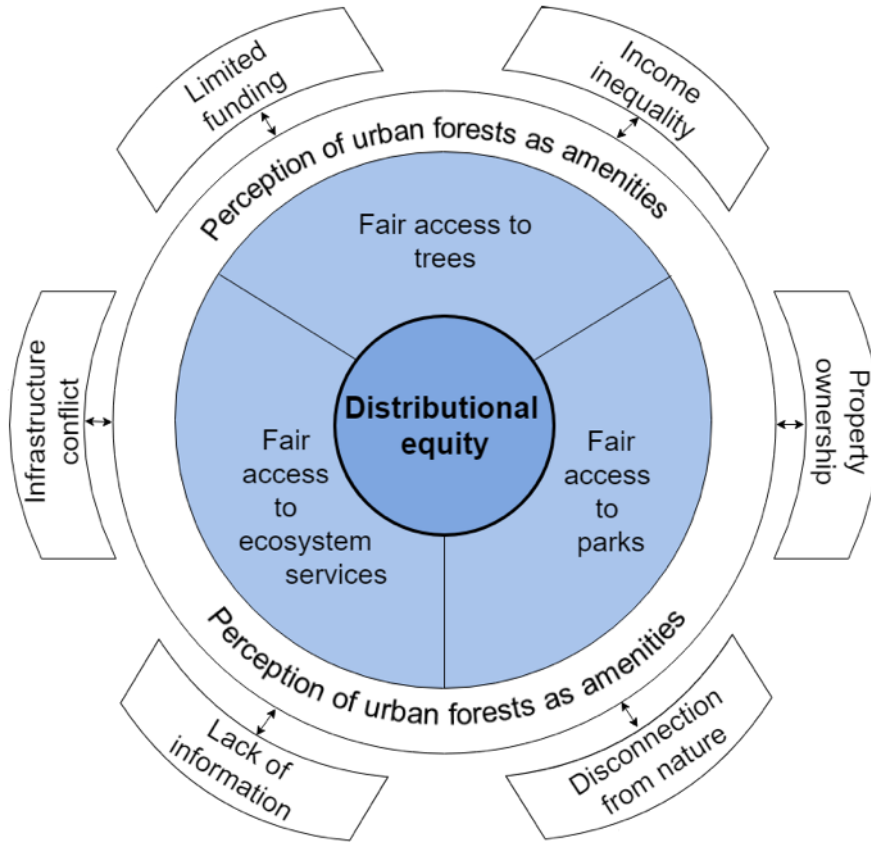

Methods

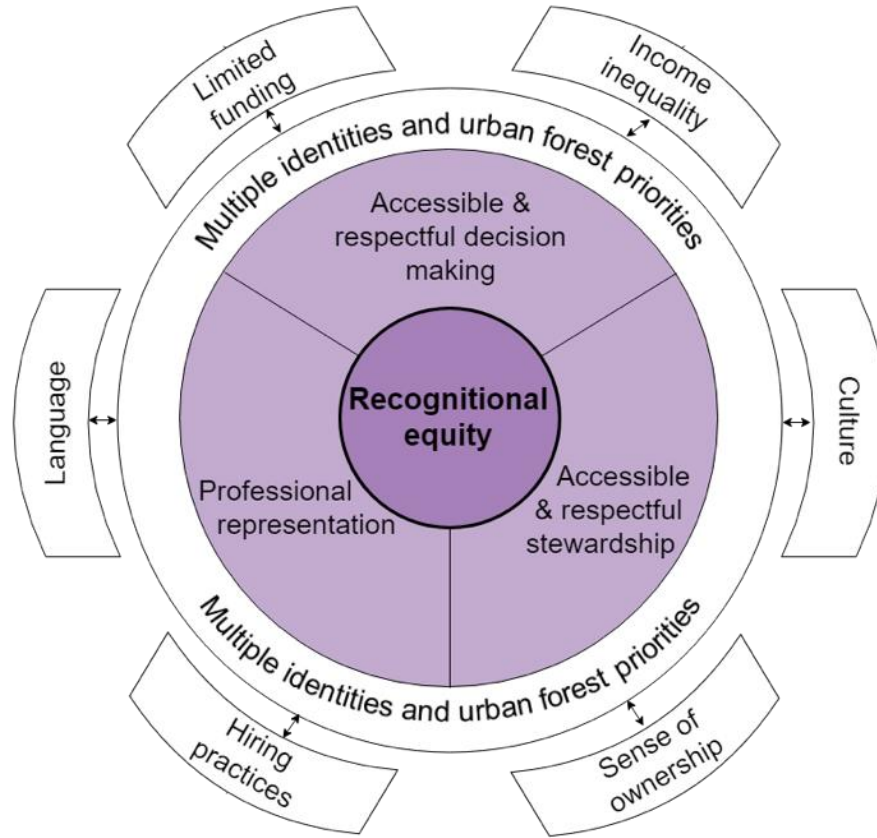

- Semi-structured interviews
- 34 practitioners across all cities (municipal/regional govt., NGOs, community members, academic, business)
- Thematic analysis to identify and quantify themes/sub-themes and relationships with each other

Results

- Distributional equity emphasized over recognitional equity
- Similar themes among municipalities
- Equity plays out through distinct local issues

Results

- Distributional equity emphasized over recognitional equity
- Similar themes among municipalities
- Equity plays out through distinct local issues

Results

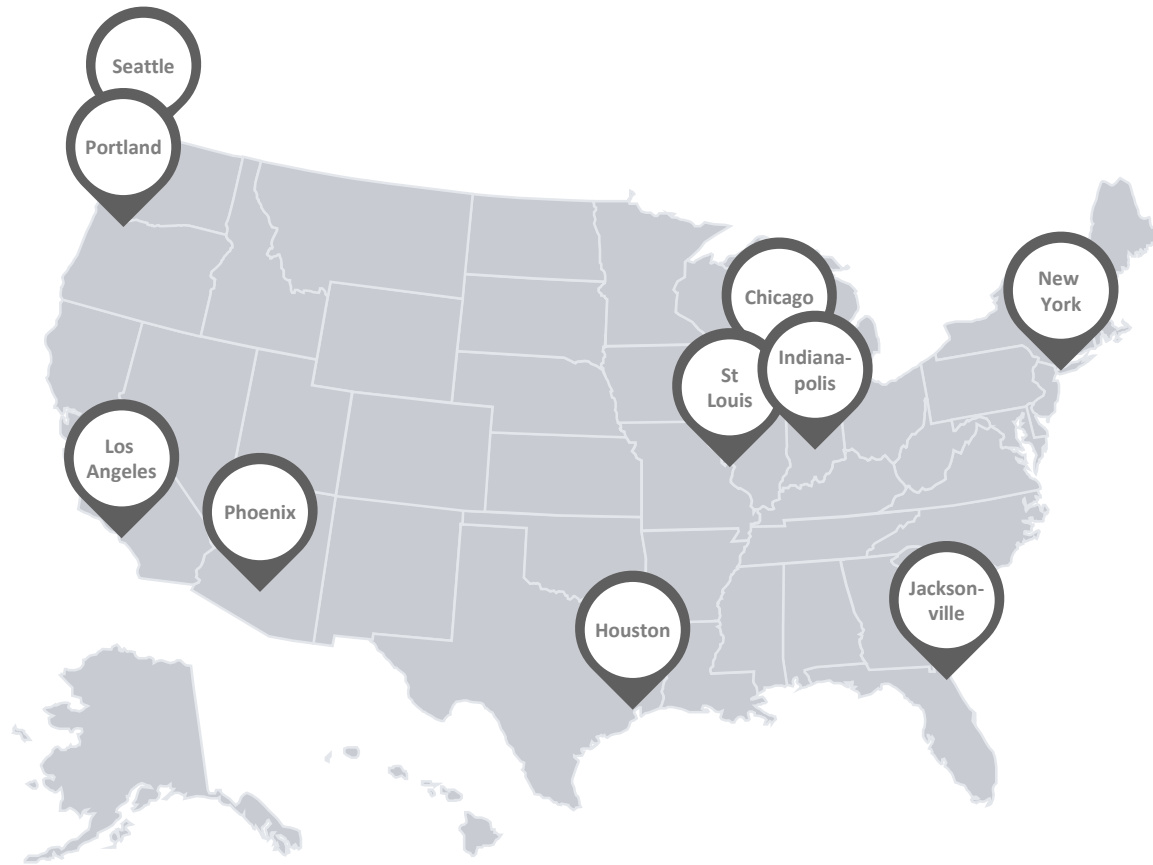

- Distributional equity emphasized over recognitional equity
- Similar themes among municipalities
- Equity plays out through distinct local issues

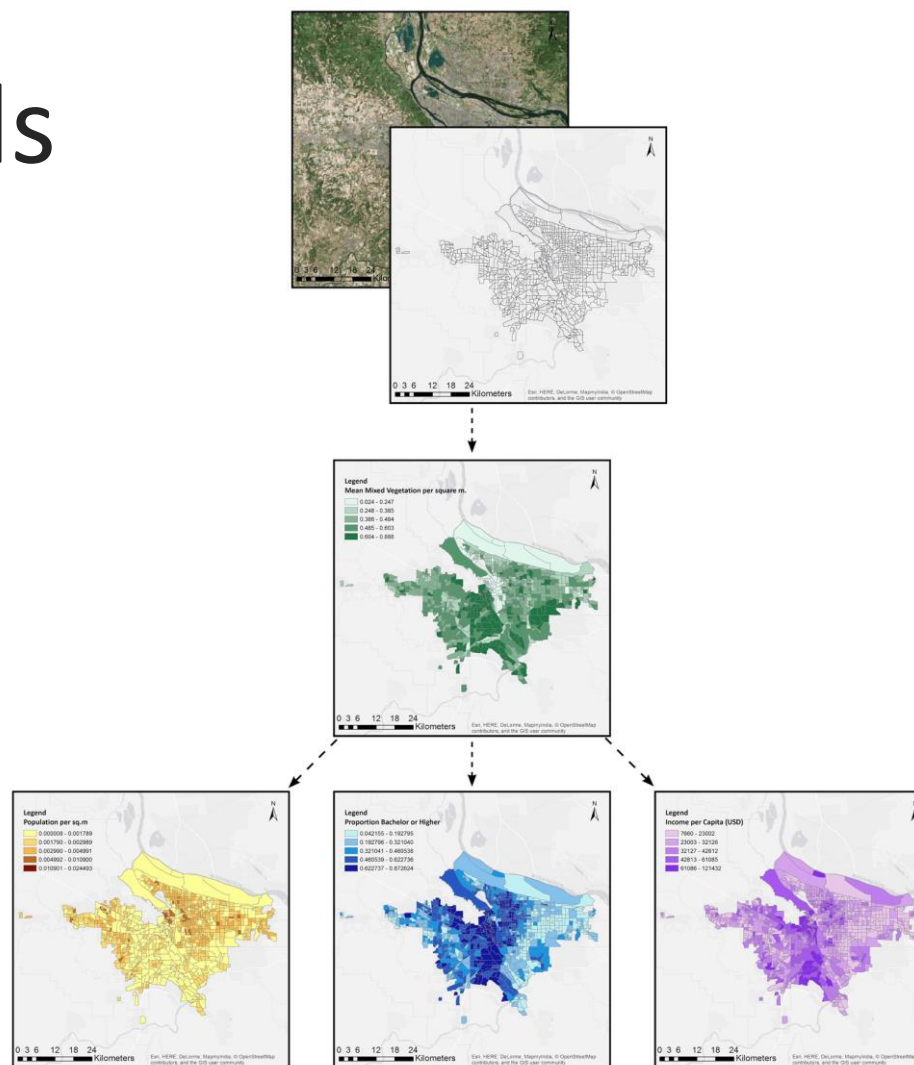

Distributional green equity: a spatial analysis

What are the principal socioeconomic factors associated with urban vegetation distribution across multiple urban areas and vegetation types?

Are different types of urban vegetation differentially distributed?

Methods

Results

- Income and education most strongly positively associated with urban forest access
- Park area is more equitable than mixed/woody vegetation cover
- Racialized populations have lower access in richer, larger, denser cities
- *Why might this be the case?*

Results

- Income and education most strongly positively associated with urban forest access
- Park area is more equitable than mixed/woody vegetation cover
- Racialized populations have lower access in richer, larger, denser cities
- *Why might this be the case?*

Results

- Income and education most strongly positively associated with urban forest access
- Park area is more equitable than mixed/woody vegetation cover
- Racialized populations have lower access in richer, larger, denser cities
- *Why might this be the case?*

Implications

- Urban forests are generally desirable
- Canopy enhancement should focus on lower-income/lower-education and racialized neighbourhoods
- Urban forest interventions should also include recognitional equity
- Inclusive decision making, accessible stewardship

Implications

- Urban forests are generally desirable
- Canopy enhancement should focus on lower-income/lower-education and racialized neighbourhoods
- Urban forest interventions should also include recognitional equity
- Inclusive decision making, accessible stewardship
