✓ **344 km².**

✓ **2'350,915 inhabitants**

✓ **Tropical savanna climate.**

✓ **Two climatic periods:**

The rainy and warm season from January to April (**1001.9 mm of rain**).

The dry and cold season from May to December.

✓ **Two biomes: dry forest and mangrove forest.**

Source: Google Earth

- Comfort index between High precaution (33°C to 41°C) to a range of Danger ($> 41^{\circ}\text{C}$), (INAMHI, 2015)
- $6.20 \text{ m}^2/\text{inhab}$ of green areas. The World Health Organization suggests that every city should have a minimum of $9 \text{ m}^2/\text{inhab}$. (World Health Organization, 2010)
- No database of the urban trees thus challenging to determine.

Problem statement

Introduction

Methodology

Results and Discussion

Conclusion and Recommendation

Human pressure, through many ways, has an effect on the vitality of trees:

high sealed surfaced for planted trees, inadequate growing space, unsuitable tree species, damage to trees, lack of management among others.

<i>Ficus benjamina</i>	93	Moraceae	Introduced
<i>Cassia siamea</i>	158	Fabaceae	Introduced
<i>Samanea saman</i>	159	Fabaceae	Native
<i>Mangifera indica</i>	214	Anacardiaceae	Introduced
Total	844		

✓ 33 species

✓ 13 families

✓ 64% (20 species) are introduced

✓ 36% (13 species) are native

✓ 5 frequent species > 50 individuals

✓ Rule of 10-20-30:

✓ The tree species that surpass the 10% are:

✓ *Ficus benjamina* with 11%

✓ *Cassia siamea* with 19%

✓ *Samanea saman* with 19%

✓ *Mangifera indica* with 25%.

✓ There are 29 genera recorded with less than 20% of representation.

✓ The family Fabaceae exceeds the rule with 33%.

Based on observed means.

The error term is Mean Square(Error) = .551.

*. The mean difference is significant at the 0.05 level.

Status

- Low tree cover.
- The population density does not have an effect on abundance and vitality of trees.
- The abundance of trees is related to sites with urban planning, and the vitality to the species found
- There is a low diversity of species.

**Condition and
Suitable trees species**

- The results indicate that mainly all trees are in a good state while the *Mangifera indica* is in a healthier condition.
- However, there is a need for further assessment and proper management for individuals that have critical observations.

Future planning

- As a guide to create awareness of a low and uneven tree cover.
- As a base for the selection of tree species and balance between introduced and native species.
- To create a list of tree species that are not suitable for being used as street trees.
- The methodology applied to this research for the assessment of the tree condition can be applied to improve the tree management in public and private lands.
