GROWING the Urban Forest:

Planning & Designing with Trees Today for Sustainable Cities of Tomorrow

Urban Forests are ecosystems characterized by the presence of trees and related flora and fauna, the soils and landscapes they populate and the air and water resource they coexist with, all in a dynamic association with people and their human settlements.

expanding urban footprint and its The on the environment, in our cities and beyond, emphasizes the need to rethink how we plan and manage our growing urban centers.

The sustained health and well-being of ALL animate and inanimate components of the urban ecosystem requires an interdisciplinary incorporation of art, science, theory and practice into all aspects of its management. Sustainable planning and design must focus on decreasing the extent of impervious surfaces and sealed soil if we are to reduce resulting environmental impacts: storm water run-off and the urban heat island effect and, at the same time, GROW the Urban Forest.

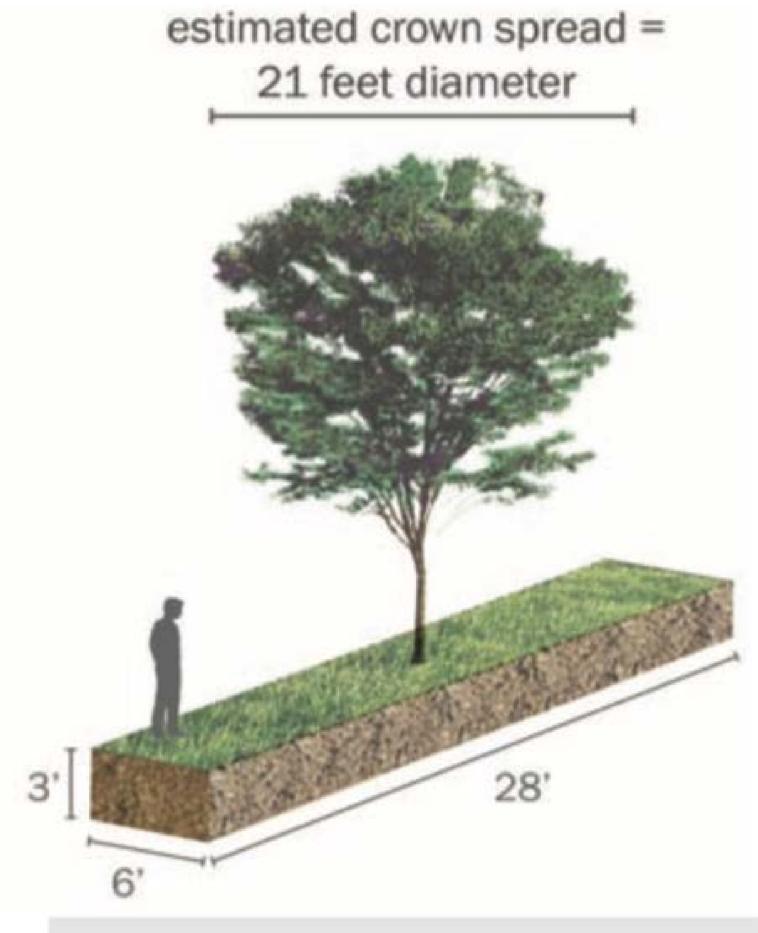

Trees require an adequate open and accessible soil volume to facilitate root expansion and thus enable growth into maturity, essential to realizing invaluable Ecosystem services benefits. That volume has been estimated at 1-2 cubic ft of accessible soil for every estimated crown spread =

square foot of crown diameter.

Growing the Urban Forest's trees to maturity must include a spatial resource evaluation that provides for a sustainable volume of a living soil organism

Soil Volume = 120 cubic feet

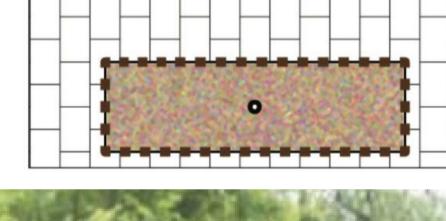

Soil Volume = 500 cubic feet

Soil Volume = 1000 cubic feet

Increasing open soil area:

Constructing root paths:

Covered soil using porous paving in design combinations:

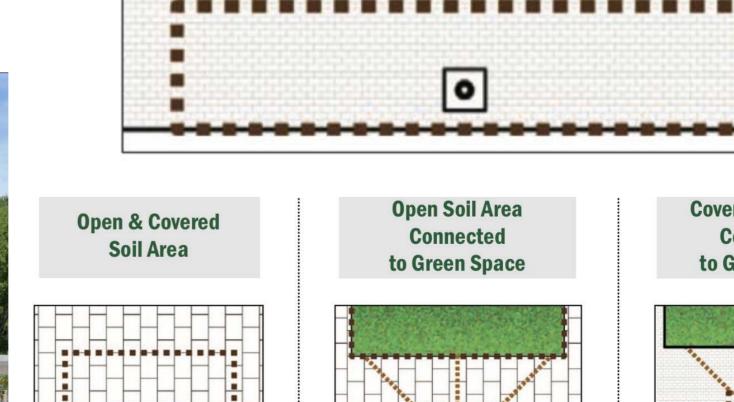

Porous dry-laid pavers

to Green Space

Structural soil + porous pavers Permavoid soil cells + varied porous walkable surface treatments

Alternative planting designs: cluster plantings in urban tree islands have been used as traffic calming measures in residential communities while providing trees' roots the communal space to develop essential interconnections, making better use of a larger shared soil volume and using less space than conventional inline plantings.

Growing a dynamic Urban Forest resource today can foster tomorrow's sustainable human settlements for the well-being of all residents of our ecosystem.
