Trees, history and cities: The oriental saga

Presentation outline

1. Hunting and gathering existence
2. Sedentary agricultural livelihood
3. Advent of ancient cities
4. Modern western influence
5. Recent opportunities and challenges

1. Hunting and gathering existence

Steeped in tree lores and traditions

- Trees being bigger, stronger, more majestic, longer living than many organisms
- Trees as benevolent provider and protector of humans
- The world and human fate controlled by nature
- Profound and universal emotional bonding between trees and humans
- Commonality traversing geographical, temporal and cultural divides

- Primitive people held trees in high esteem or in awe
- Special status: admiration, respect, adoration, veneration, worship
- Mythologies, legends and folklores, echoing deep love and fear of trees
- Bestowing sacred status to trees or groves: Deities or abodes of certain spirits
- “Tree of Life” belief permeating through a succession of ancient cultures
- Cultural equifinality, same human species, same love and fear, same fate and destiny

Fraternity tie (mitini) between
trees and people, Sikkim

World Forum on
Urban Forests
Mantova 2018

- Preserving tree worship behaviours and rituals
- Contributions to nature conservation

Jinping County, Guizhou

Takao, Tokyo

Key traits and commentary

- From Palaeolithic, forest as Mother of humanity
- The colossal tree connecting earth to heaven
- Passage to deities and the sun
- Strong belief in the immortal tree
- Symbolizing health and longevity, continuity and prosperity
- Probably related to the sacred Mulberry Tree:
Domesticated in northern China

2. Sedentary agricultural livelihood

Pragmatic benefits of trees to agrarian society

- Deeply-rooted traditional belief system in East Asia: China, Japan and Korea
- Systematically practised as *fengshui* (wind and water or geomancy) *woodland*
- Wrapping village settlements in horseshoe configuration
- Soil and water conservation
- Microclimatic amelioration (wind, fresh air, moderated temperature)
- Sustaining natural conditions for human welfare and survival

Key traits and commentary

- Keeping natural layered forest biomass structure and indigenous species
- Enriched with economic and medicinal plants
- Limited harvesting: fruits, nuts, herbal medicine, fodder, game, timber, firewood
- Biodiversity hotspots, contributing to nature conservation

- Sustainable protection for centuries by superstition
- Taboo and sanction tied to sacredness and deities (surrogate law enforcement)
- Protected by fear of supernatural retribution on present and future generations
- Scholars' way of communicating an abstract idea to illiterate peasants
- Conservation by cultural internalization of a common belief
- *Progenitor or precursor of urban forestry* (forest contiguous to settlement)
- Pioneer of *trans-generational urban forestry* (inherited and inheritable)

3. Advent of ancient cities

Practicality of planting trees in urban settlements

- Sustenance: Fruits, nuts, fodder, timber
- Sensory: Shading, cooling, scent, sound
- Cognitive: Aesthetic, nostalgic, re-connection with nature
- What and where to plant: Amenities versus disamenities

Symbol of power, wealth, prestige and taste

- Selected main roads for regular passage of royalty and officials
- Plaza or market place where people congregate for long durations
- Religious and institutional sites
- Private gardens of aristocracy, nobility, gentry and merchant

Qing Court Version of *Along the River During the Qingming Festival*; original scroll by Zhang Zeduan (張擇端) of Northern Song Dynasty, depicting the capital Bianjing in c. 1100 BP

Urban Forests
Mantova 2018

City gate [Tree transplanted with wrapped root ball; spontaneous vegetation on masonry city wall; tree row along city wall]

World Forum on
Urban Forests
Mantova 2018

Rustic scene [Tree row along linear waterfront
settlement, country roads and field edges]

Key traits and commentary

- Ancient cities, especially walled ones, were usually small and dense with limited space for trees
- Proximity to nature, literally at the town's doorstep
- Little need for nature's surrogates in the town, yet trees still planted in cramped niches
- Residences of well-off families with enclosed private gardens

Lijiang c. 700 BP
UNESCO World Heritage Site

World Forum on
Urban Forests
Mantova 2018

Pingyao 2700 BP; dense walled city
UNESCO World Heritage Site

Trees scattered in tiny interstitial
niches amongst tightly packed
house

- Population increase: Infilling and densification, squeezing out intra-mural gardens
- Some rich families moved to live outside the city walls: Prototype suburbs
- Not just losing gardens and trees: Displacing people with the background, mentality, intention, appreciation, and experience of planting in urbanized areas
- Densified walled towns entered the dark age of urban greening
- Remnant residences in old town: Intra-mural villas with embedded green pockets

Scholar's gardens

- Sacred, religious and institutional sites often persisted with old trees
- Cemeteries of renowned personalities with tree cover
- Confucius' tomb (c. 1500 BP) with diverse tree collection brought by his disciples from lands near and far
- Regarded as the first arboretum in China

4. Modern western influence

Western colonial and other influences

- Mainly 18th to 19th century
- European urban greening practices established since the Renaissance and matured in the Industrial Revolution
- Avenue, promenade and esplanade planting
- Squares and plazas
- Urban parks and public gardens
- Botanic garden (for science and resource use)

- Suburban villas and country estates with private gardens
- Military sites: Spacious with good tree cover
- European landscape fads and fashion
- Exotic species introduced from Europe and other colonies
- Jump migration of plants following movement of people and goods
- Homogenization of urban plant species in different cities
- Examples: Hong Kong, Macau, Singapore, Guangzhou, Xiamen, Shanghai, Taipei

Garden city estate, Hong Kong

Key traits and commentary

- Superposition of western influence on existing baseline
- Previously: Individual land owners' idiosyncratic choice of species, geographical provenance, planting site, planting pattern and tree care
- Individual decisions collectively constitute the city's urban tree stock
- Western planting: Regimentation in public space, plus personal preferences
- Using exotic species: Original landscape character diluted by exotic ingredients

Shamian Island, Guangzhou

- Some private gardens acquired by the government
- Some donated by or bequeathed to the community
- High-quality ready-made urban parks or public gardens
- Institutional, religious & cemetery grounds with persistent land use: Preserving old trees
- Suburbs engulfed by urban expansion: Bland residential areas with few trees
- Urban sprawl: Destroying original peri-urban woodlands

Barracks and cemetery, Hong Kong

- Planning and custodian of urban forest: Mainly civil servants moulding city landscape
- First time in history of urban greening: So many (trees and their enjoyment by citizens) determined by so few
- Decision of the few: May make or mar the city's sylvan character
- Foster citizen engagement in urban forest decisions

5. Recent opportunities and challenges

The dominant urban era

- Over half of human population living in cities in 2018, reaching 70% by 2050
- Looming climate change and massive environmental degradation
- Grave consequences on mortality, morbidity and health care
- Nature-based solutions to ameliorate or prevent further decline

Comprehensive urban renewal

- Redevelopment of old urban cores and neighbourhoods
- Conversion to high-rise and high-density
- Clean slate approach: Overhaul town plan
- Often obliterating existing greenery, including old trees
- New greening standards and landscape design
- Address environmental inequality

Xintiandi and Taipingqiao, Shanghai

New tree-friendly development mode

- Pedestrianize shopping streets or precincts
- Convert some streets to linear parks, greenways or blueways
- Restore urban rivers and canals
- Revitalize old building sites
- Provide liberally green spaces, water features, green roofs and green walls
- Transfer development rights to create green spaces

Daan Forest Park, Taipei

Cheonggyecheon Restoration, Seoul
